

AI research for your next sales conversation

For B2B sales teams, agencies, and founders. InsightIQ turns public prospect research into a brief shaped around what you sell.

Conversation angles you can test

Vercel example: product detail

Source claim

Guillermo Rauch created Next.js and Vercel with a focus on developer experience (DX) to make the Web faster.

Why it could matter

If the stated focus on developer experience to make the Web faster means Vercel actively tracks where new users struggle, then onboarding funnel analytics combining usage metrics and session feedback might help prioritize documentation and product fixes more effectively.

Hypothesis to validate

Ask in the conversation

How do you currently identify which parts of the initial developer setup cause the most friction?

Meeting preparation

Talking points and questions that help test the fit.

Personalized outreach

A relevant opener and draft shaped around your offer.

How InsightIQ works

Source claims, conditional hypotheses, and questions stay distinct. The seller can inspect the evidence and test whether an angle fits.

The research journey

- 01 Save context** The prospect, offer, and chosen goal stay together.
- 02 Find sources** Tavily discovers public company and prospect signals.
- 03 Build evidence** Qwen via DashScope extracts claims. LangGraph builds cited angles and checks their evidence links.
- 04 Review and reuse** Inspect sources and gaps, then copy, export, or refresh the output.

Built for background research

Next.js web app on Cloudflare. NestJS API, Python worker, and PostgreSQL on a VPS. PostgreSQL also tracks the job queue.
